NEW GOLF GREEN ESTABLISHMENT

The following formula has been very successful in establishing new golf greens:

1. Pre-plant incorporate GroWin @ 50# per 1000 sq. ft. or combo of GroWin and Sand-Aid @ 25 lb. each per 1000 sq. ft.
2. Starter Fertilizer Par Ex 10-18-22 @ 10 lb. per 1000 sq. ft.
3. Pre-plant incorporate granular micro-nutrient such as Anderson Hi-Mag Atep @ 5 lb per 1000 sq. ft.
4. Use 10 pounds of Milorganite to 1 pound Bentgrass seed. Blend together in cement mixer for best results. This makes seed easy to spread.
5. Seed at 20 lbs. of material per 1000 sq. ft. This gives you two (2) pounds of Bent seed per 1000 sq. ft. Apply in at least two different directions for more even coverage. i.e. 10 pounds of mix criss-cross pattern.
6. Apply Granular Subdue Pythium Control @ recommended rate.
7. Roll down tight and begin watering program. Remember not to over water and flush seed and nutrients. Light, frequent watering is suggested through even germination and establishment. About 5 minutes per hour during daylight hours; 10 minutes if it is real windy.
8. Once seed is up uniformly (approximately 2 weeks) apply Griggs Turf Rally organic 16-4-8 @ 5 lbs. per 1000 sq. ft.
9. Once sprayer can be driven on green, begin applications of Bio Turf Gro products such as Nutra Green 5-10-5 at 5 qts. per acre along with fungicide program. Add to that CPR on greens as soon as possible. Use 2 gal per acre every two weeks throughout Fall season.
10. Apply preventative snow mold control approximately November 20th to December 20th.
11. At same time apply Par Ex 21-3-16 Slow release as a Winter feed. Use one (1) bag per average green of 5000 sq. ft.

(All eleven steps of establishment cost about \$625.00 per average 5000 sq. ft. green.)
